VibraJect

The Injection Syringe Analgesic

The Revolutionary Dental Syringe Attachment that Vibrates the Needle, Effectively Eliminating the Pain and Discomfort of All Types of Injections

Based on the "Gate Control Theory" the nerves first sense the vibrations and essentially block the signal of pain.

Faster - No need for applying a topical and waiting for it to take effect.

Easier - The vibrating needle enters the tissue with less force required.

Better - Effective on all injections, including palatal, mandibular blocks, nasal palatine, children, and patients who are highly pain sensitive or needle phobic.

Economical - Based on the life expectancy, the cost is approximately 5 cents per patient, and there are no additional costs for disposable items.

Convenient - Simply attach to all standard, and some disposable, dental syringes, including intraligamental. No special technique to learn.

Practice Builder - Patients are so relieved after they experience the pain-free VibraJect, they tell their friends and relatives about it.

COMPLETE KIT

Contains three autoclavable clips that remain attached to the syringe, one motor cartridge, and three sets of 1.5V batteries, which are commonly available.

VibraJect

The easy way to take the pain out of all injections
